

DHCP within LAN.

DHCP uses UDP as transport layer protocol.
we make server as DHCP server so that
all end devices dynamically get IP address.

→ The major outcome was that we learnt
to make DHCP server, and how to
dynamically assign IP-address to end devices.

→ DHCP DORA process stand for following
messages b/w client & server.

→ we configured the server, put the start,
end range, no of user after turning DNS
on in DHCP and see that IP address is
configured.
